

It doesn't matter whether you need a single tier shelf store or a multi-tier storage installation - together we'll develop your customised storage solution from the total of 35 standard components in the Hi280 system. Tailor-made for the materials you store and your operating procedures, and precisely fitting your existing space in height, depth and width.

Installations up to four levels high and with a total height of up to 12 metres can be built using Dexion Hi280 - optionally with a straight-through continuous floor design and divided frame or with a continuous frame and walkways suspended from it. Even with unusual shelf depths and bearing loads, for which other suppliers already need to change the system, you can rely on the stability and function of Dexion Hi280.

UNCOMPLICATED ASSEMBLY

Assembling the frame of Hi280 is no problem even for the layman. Standardised support frame elements guarantee easy assembly. All the other components can simply be pushed in and hung on afterwards - all without nuts and bolts.

MAXIMUM STABILITY

Due to its particularly robust construction and high-quality workmanship, even exceptional rack heights, depths and load-bearing capacities are no problem for Dexion Hi280 - even without a change of system. Even the wide span shelving used for storing larger components or large quantities of small parts can be assembled in the Hi280 system.

OPTIMUM USE OF SPACE

No matter which stored goods you want to house, or in which space situation; Hi280 adapts to fit the circumstances perfectly. By using the appropriate frame,

the system can even be expanded up to a four-tier rack installation with a maximum total height of 12 metres.

HIGH QUALITY WORKMANSHIP

To guarantee the durability of your system, all the Hi280 components are permanently protected against environmental effects - from the support columns and shelves down to the smallest single part. For example, the surfaces of all the profiled components are not only treated in the visible area but also zinc-galvanised on the inner surfaces. In addition to the exceptionally good durability, our clients repeatedly confirm an additional advantage of zinc-galvanised surfaces; which reflect light considerably better than painted finishes. The result: Dexion's rack installations need less expensive lighting to give optimum visibility - an additional contribution to greater economy.

OPTIMUM ADAPTATION

Does your warehouse need to grow? Or is the composition of the goods to be stored changing? No problem with any of them: no matter how your needs change in the future - Hi280 adjusts to fit. Thanks to the modular and extremely robust construction, there are no problems either in removal or rebuilding.

EXTENSIVE RANGE OF ACCESSORIES

With its extensive range of accessories, Hi280 adjusts perfectly to fit your requirements. You can combine all the elements exactly as you need - from shelf dividers through pull-out shelves, rear walls or grids to drawers and door elements. This special flexibility makes the system usable almost without limit - for example even in ship shelving. Tailor-made, custom-fitting solutions to build shelves using Hi280 create undreamt of storage space on ships of all sizes.

Dexion already set standards in flexibility and customer orientation 50 years ago with the idea of using perforated steel profiles for storage technology. We continue to develop and manufacture products in Europe and Scandinavia right up to the present day - not just for our customers but together with them.

Hi280 from Dexion - the evolution of the storage system

Dexion is the specialist in customised, efficient warehouse logistics solutions. Based on our many years of experience in storage technology and constantly exchanging information with our customers, we make continuous well-aimed improvements in our products - technically, qualitatively and conceptually.

Dexion maintains a network of six marketing and distribution offices throughout Europe and Scandinavia

- which means we are never very far from any of our customers. That pays dividends as well; in terms of exceptionally short journey distances, rapid response and delivery times and the highest possible degree of flexibility.

After all, we don't just want to sell you any off-the-peg systems. Instead we want to work with you to develop a customised, variable storage solution that corresponds exactly

to your needs. Like the Hi280 clip-together shelving system: because of its modular construction, there are no problems in adapting this system to meet changed demands - so it's an optimum solution for current tasks and a rewarding investment in the future.

Hi280 adapts perfectly to any space situation - from a single-level bin-rack store to a four-storey rack installation with a maximum total height of 12 metres

Flexibility, Extendability,
Adjustability
